Drinking Water Quality Report for 2024

City of Douglas Department of Public Works

June 2025

Este informe contiene información muy importante sobre el agua que usted bebe. Tradúscalo ó hable con alguien que lo entienda bien. También puede obtenerse una copia en español llamando a (520) 417-7329. If you are a non-English speaking resident, we recommend that you speak with someone who understands the report.

We are pleased to present the Annual Drinking Water Quality Report for calendar year 2024. The Federal Safe Drinking Water Act requires that we issue an annual Consumer Confidence Report.

Drinking Water Source

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Douglas Water Source

The City of Douglas serves approximately 15,638 people. There are presently six (6) deep wells that produce high-quality water for public distribution in the City. Hydrologic studies have indicated that the water resources available are generous, with active recharge from the Mule, Dagoon, and Chiricahua mountain ranges. Water stored in the sand and gravel beds of the Douglas Basin Aquifer is adequate to supply our needs for years to come. The wells are widely separated to minimize the risk of any potential local contamination or naturally occurring quality problems. Each of the wells is individually tested to ensure compliance with all applicable standards and regulations. Not all wells are necessary to provide daily needs, but all are run periodically to keep them in operating condition. The average daily usage in our community in the wintertime is 3.1 million gallons per day. Peak usage in our community in the summertime is approximately 4.3 million gallons per day. Each well is equipped with its own gas chlorinator to provide sufficient amount of chlorine for protection from bacteria. The City of Douglas continues to work diligently to achieve compliance with all safe drinking water standards and regulations. On March 15 2022, the Arizona Department of Environmental Quality (ADEQ) conducted an inspection of our Water Distribution System and the report confirmed that we are in full compliance. We continue in our commitment to provide high quality and safe drinking water to all City customers.

Drinking Water Contaminates

Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides, herbicides that may come from a variety of sources, i.e. agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and also may come from gas stations, urban stormwater runoff, and septic systems.

Radioactive contaminants, that can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Arizona Department of Environmental Quality prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Vulnerable Population

Drinking water, including bottled water, may be reasonably expected to contain at least small amounts of contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV-AIDS, or other immune system disorders, some elderly, and infants can be particularly at risk of infections. These people should seek advice about drinking water from their health care providers. For more information about contaminants and potential health effects, or to receive a copy of the U.S. Environmental Protection Agency (EPA) and the U.S. Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by cryptosporidium and microbiological contaminants, call the EPA Safe Drinking Water Hotline at 1-800-426-4791.

Source Water Assessment

The ADEQ conducted a source water assessment for our City water wells. The assessment included the review of adjacent land uses that may pose a potential risk to our water sources. These risks include, but are not limited to, underground storage tanks, gas stations, landfills, dry cleaners, and wastewater treatment plants. Once ADEQ identified the adjacent land uses, they were ranked as to their potential to

affect the water source. Due to the extensive regulations and guidelines for water quality testing, drinking water in the United States is among the cleanest and safest in the world. However, the quality varies over time due to changes in the water source from which it is drawn and the treatment it undergoes. Based on the information currently available on the hydrogeologic settings and the adjacent land uses that are in the specified proximity of the drinking water source(s) of this public water system, the ADEQ has given a high risk designation for the degree to which this public water system drinking water source(s) are protected. A designation of high risk indicates there may be additional source water protection measures which can be implemented on the local level. This does not imply that the source water is contaminated nor does it mean that contamination is imminent. Rather, it simply states that land use activities or hydrogeologic conditions exist that make the source water susceptible to possible future contamination. Residents can help protect this water source by practicing good septic system maintenance, taking hazardous household chemicals to hazardous material collection sites, and limiting pesticide and fertilizer use. A copy is available from ADEQ, 1110 W. Washington Street, Phoenix, Arizona, 85007, or an electronic copy can be requested from ADEQ at Walkinshaw.laurn@azdeq.gov. Visit the ADEQ website at: www.azdeq.gov/environ/water, or contact the City of Douglas Water Division Supervisor Elberto Acosta at 520-417-7538 or Elberto.acosta@douglasaz.gov

Definitions / Acronyms (for the City's Water System Contaminants Table)

AL-Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements.

MCL-Maximum Contaminant Level - the "Maximum Allowed" is the highest level of a contaminant that is allowed in drinking water.

MCLG-Maximum Contaminant Level Goal - the "Goal" level of a contaminant in drinking water below which there is no known or expected risk to health.

MFL-Million Fibers per Liter

MRDLG-Maximum Residual Disinfectant Level Goal

MREM-Millirems per year - a measure of radiation absorbed by the body.

MRDL-Maximum Residual Disinfectant Level

NA-Not Applicable - sampling was not completed by regulation or was not required.

NTU = Nephelometric Turbidity Units - measure of water clarity.

PPM = Parts per million or mg/L Milligrams per million. ppm x 1000 = ppb

PPB = Parts per billion or µg/L Micrograms per liter. ppb x 1000 = ppt

PPT = Parts per trillion or Nanograms per liter. ppt x 1000 = ppq

PPO = Parts per Quadrillion or Picograms per liter

PCi/L-Picocuries per liter - picocuries per liter is a measure of the radioactivity in water.

RAA-Running Annual Average - an average of monitoring results for the previous 12 calendar months.

TT-Treatment Technique - a treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Lead Informational Statement

Lead can cause serious health problems, can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

The City of Douglas is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in plumbing components in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

Before drinking tap water, flush your pipes for several minutes by running your tap, taking a shower, doing laundry or a load of dishes. You can also use a filter certified by an American National Standards Institute accredited certifier to reduce lead in drinking water.

To address lead in drinking water, public water systems were required to develop and maintain an inventory of service line materials by Oct 16, 2024. Developing an inventory and identifying the location of lead service lines (LSL) is the first step for beginning LSL replacement and protecting public health. A copy of the lead service inventory will be provided upon request. Please contact us if you would like more information about the inventory or any lead sampling that has been done.

If you are concerned about lead in your water and wish to have your water tested, contact the City of Douglas at 520-417-7329. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <http://www.epa.gov/safewater/lead>.

Health Effects Language

Nitrate, in drinking water at levels above 10 ppm is a potential health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Levels may rise quickly for short periods-of-time because of rainfall or agricultural activity. If you are caring for an infant, and detected nitrate levels are above 5 ppm, you should ask for advice from your health care provider.

If **Arsenic** is less than or equal to the MCL, your drinking water meets EPA's standard. EPA's standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. EPA continue to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Lead, in drinking water, is primarily from materials and components associated with service lines and home plumbing. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. The City of Douglas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

Water System Detected Contaminants

	TT Violation Y or N	Number of Samples Present	Samples Absent (A)	MCL	MCLG	Sample Month & Year	Likely Source of Contamination
Total Coliform Bacteria (System takes ≥ 15 monthly samples)	N	1	183	0	0	2024	Naturally Present in Environment
Disinfectants	MCL Violation Y or N	Running Annual Average (RAA)	Range of All Samples (Low-High)	MCL	MCLG	Sample Month & Year	Likely Source of Contamination
Chlorine (ppm)	N	2	1 – 2	MRDL = 4	MRDLG = 0	2024	Water additive used to control microbes
Disinfection By-Products	MCL Violation Y or N	Running Annual Average (RAA) OR Highest Level Detected	Range of All Samples (Low-High)	MCL	MCLG	Sample Month & Year	Likely Source of Contamination
Haloacetic Acids (HAA5) Stage II (ppb)	N	ND	<0	60	N/A	2024	Byproduct of drinking water disinfection
Total Trihalomethanes (TTHM) Stage II (ppb)	N	7	1 – 7	80	N/A	2024	Byproduct of drinking water disinfection
Lead & Copper	MCL Violation Y or N	90 th Percentile	Range of All Samples (Low-High)	AL	ALG	Sample Month & Year	Likely Source of Contamination
Copper (ppm)	N	0.062	0.007 – 0.86	AL = 1.3	ALG = 1.3	9/2022	Corrosion of household plumbing systems; erosion of natural deposits
Lead (ppb)	N	0	0	AL = 15	0	9/2022	Corrosion of household plumbing systems; erosion of natural deposits
Radionuclides	MCL Violation Y or N	Running Annual Average (RAA) OR Highest Level Detected	Range of All Samples (Low-High)	MCL	MCLG	Sample Month & Year	Likely Source of Contamination
Alpha emitters (pCi/L)	N	5.7	1.0 – 5.7	15	0	6/2022	Erosion of natural deposits
Combined Radium 226 & 228 (pCi/L)	N	1.7	0 – 1.7	5	0	6/2022	Erosion of natural deposits
Uranium (ug/L)	N	4.6	2.1 – 4.6	30	0	6/2022	Erosion of natural deposits

Inorganic Chemicals (IOC)	MCL Violation Y or N	Running Annual Average (RAA) <u>OR</u> Highest Level Detected	Range of All Samples (Low-High)	MCL	MCLG	Sample Month & Year	Likely Source of Contamination
Arsenic (ppb)	N	2.5	1.4 – 2.5	10	0	6/2022	Erosion of natural deposits; runoff from orchards; runoff from glass and electronics production wastes
Sodium (ppm)	N	100	74 - 100	N/A	N/A	6/2022	Erosion of natural deposits
Barium (ppm)	N	0.1	0.1 - .10	2	2	6/2022	Discharge of drilling wastes; discharge from metal refineries; Erosion of natural deposits
Chromium (ppb)	N	5.9	0 – 5.9	100	100	6/2022	Discharge from steel and pulp mills; Erosion of natural deposits
Fluoride (ppm)	N	0.34	0.31 – 0.34	4	4	6/2022	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
Nitrate (ppm)	N	3	1.02 – 3.14	10	10	6/2024	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Selenium (ppb)	N	ND	<0	50	50	6/2022	Discharge from petroleum and metal refineries; erosion of natural deposits; discharge from mines

Requirements Not Met:

Violations
Late Reporting Violation- Wrong number of samples reported on May 29, 2025. Time period January – May 2025. Corrective action, Corrected Typo.

Simple Steps to Save Water

Saving water around the home is simple and smart. The average household spends as much as \$600 per year on its water and sewer bill but could save about \$50 per year by retrofitting with water efficient fixtures and incorporating water saving practices.

Let Water Sense show you how to save water - and your wallet. How much money you save will depend on the cost of water where you live, but it makes sense that using less water lowers your utility bill. More importantly, using less water preserves this limited resource for generations to come.

Inside the Home

Get Flush With Savings

- Consider installing a WaterSense labeled toilet, which uses 20 percent less water while offering equal or superior performance. Compared to older, inefficient models, WaterSense labeled toilets could save a family of **four** more than \$90 annually on its water utility bill, and \$2,000 over the lifetime of the toilets.

Accessorize Your Faucet

- Installing a WaterSense labeled aerator is one of the most cost-effective ways to save water. Also, consider replacing the entire faucet with a WaterSense model. Either way, you can increase the faucet's efficiency by 30 percent without sacrificing performance.

Outside the Home

Water When Needed

- Water your lawn or garden during the cool morning hours, as opposed to midday, to reduce evaporation.
- Look for sprinklers that produce droplets, not mist, or use soaker hoses or trickle irrigation for trees and shrubs.
- Set sprinklers to water lawns and gardens only. Check that you're not watering the street or sidewalk.

Accessorize Your Spigots

- Install Anti-siphon vacuum breakers on your spigots to prevent reverse flow of water back into the distribution system.

2024 UCMR5

Water Quality Table – Unregulated Contaminants

Your drinking water was sampled between **August 2024** for the presence and concentration of 29 different per- and polyfluoroalkyl substances, some known by the acronyms PFAS, PFOA, PFNA, PFHxS, PFBS, and GenX, a group of contaminants in the final stages of becoming regulated by the EPA. PFAS are man-made chemicals that are resistant to heat, water, and oil. They have been used since the 1940s to manufacture various consumer products, including fire-fighting foam and stain resistant, water-resistant, and nonstick items. Many PFAS do not break down easily and can build up in people, animals, and the environment over time. Scientific studies have shown that exposure to certain PFAS can be harmful to people and animals, depending on the level and duration of exposure.

To learn more about this group of chemicals, we encourage you to visit the ADEQ website at <https://www.azdeq.gov/pfas-resources>. You may also read the ADEQ-provided “PFAS 101 Fact Sheet” or view ADEQ’s Introduction to PFAS video on YouTube at <https://www.youtube.com/watch?v=t44kSh0uKXE>.

Water Quality Table - Unregulated Contaminant Monitoring Rule

One Metal	Detected (Y/N)	Average	Range of All Samples (Low-High)	MRL (ppb)	Analytical Methods
Lithium (ppb)	Y	76.73	36.2 – 150	9 µg/L	EPA 200.7, SM 3120 B, ASTM D1976–20

PFAS samples were collected on August 2024 and were not detected (ND) in the water. Below are the following contaminants that were not detected.

11-chloroeicosafuoro-3-oxaundecane-1-sulfonic acid (11Cl-PF3OUdS), 1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS), 1H, 1H, 2H, 2H-perfluorohexane sulfonic acid (4:2 FTS), 1H, 1H, 2H, 2H-perfluorooctane sulfonic acid (6:2 FTS), 4,8-dioxa-3H-perfluorononanoic acid (ADONA), 9-chlorohexadecafluoro-3-oxanone-1-sulfonic acid (9Cl-PF3ONS), hexafluoropropylene oxide dimer acid (HFPO-DA) (GenX), nonafluoro-3,6-dioxaheptanoic acid (NFDHA), Perfluoro-3-methoxypropanoic acid (PFMPA), Perfluoro-4-methoxybutanoic acid (PFMBA), Perfluorobutanesulfonic acid (PFBS), Perfluorobutanoic acid (PFBA), Perfluorodecanoic acid (PFDA),

Perfluorododecanoic acid (PFDoA), Perfluoroheptanesulfonic acid (PFHpS), Perfluoroheptanoic acid (PFHpA), Perfluorohexanesulfonic acid (PFHxS), Perfluorohexanoic acid (PFHxA), Perfluorononanoic acid (PFNA), Perfluorooctanesulfonic acid (PFOS), Perfluorooctanoic acid (PFOA), Perfluoropentanesulfonic acid (PFPeS), Perfluoropentanoic acid (PFPeA), Perfluoroundecanoic acid (PFUnA), n-ethyl perfluorooctanesulfonamidoacetic acid (NEtFOSAA), n-methyl perfluorooctanesulfonamidoacetic acid (NMeFOSAA), Perfluorotetradecanoic acid (PFTA) and Perfluorotridecanoic acid (PFTrDA).
